

Amendments to the Specification:

On page 5, beginning at line 5, please replace the paragraph with the following amended paragraph:

The positive electrode mixture layer 21a is made of, for example, positive electrode materials, conducting agents such as carbon black or graphite, and binders such as polyvinylidene fluoride. As the positive electrode materials, for example, lithium composite oxide containing lithium (Li), lithium composite sulfide, metal sulfide including no lithium such as TiS_2 , MoS_2 , and NbSe_2 and V_2O_5 , compounds soluble in metal sulfides such as V_2O_5 , or oxide and specific polymer materials are preferable. One or more than two kinds of materials are selected according to the application of the battery.
